\[ f(-16) = 2(-16) - 1 = -32 - 1 = -33 \]
\[ f(34) = 3 \cdot 34^2 + 3 = 11559 \]

13. Find \( f(-1) \).

\[ f(-1) = 2(-1)^2 - 1 = 2 - 1 = 1 \]

14. Determine \( \lim_{x \to -1} f(x) \), \( \lim_{x \to -1} f(x) \), and \( \lim_{x \to -1} f(x) \) (if it exists).

15. Is the function continuous at \( x = -1 \)?

No, \( f(x) \) does not exist at \( x = -1 \) and \( \lim_{x \to -1} f(x) \) does not exist, therefore the function is not continuous at \( x = -1 \).
Suppose you are given this set of data:

\[ p(x) = 16.0249x^{0.3569} \]
\[ R^2 = 0.9097 \]
\[ p(25) = 50.5479 \]

22. Look at the graphs of the four models. Which ones seem to fit the data and the trend? Which ones don’t? Which one would you select to work with? Why is the value of \( R^2 \) alone not enough to make a choice?

\end{align*}
\]

\[
\begin{align*}
\text{Step 2:} & \quad f(x+h) - f(x) = -2x^2 - 4xh - 2h^2 - 8x - 8h - 5 - (-2x^2 - 8x - 5) \\
